

Password Generator Report

Project Title

Password Generator

Objective

The objective of this project was to develop a Python application capable of generating secure random passwords based on user-defined length.

Description

This application generates strong passwords using a combination of uppercase letters, lowercase letters, numbers, and special characters. The user enters the desired password length, and the application generates a random password.

Technologies Used

- Python 3
- Random Module
- String Module

Features

- User-defined password length
- Secure random password generation
- Includes uppercase and lowercase letters
- Includes numbers and special characters
- Simple command-line interface

Program Workflow

1. User enters desired password length.
2. Program generates a random password.
3. Password is displayed in the terminal.

Output

The application successfully generates secure passwords of varying lengths.

Screenshots

- Password Generator Execution
- Generated Password Output

Conclusion

The project successfully demonstrates Python fundamentals, user input handling, and random string generation techniques used in password security.
